TRACK PIN CUTTING TOOL

SCALE 1:1

This small tube can be obtained from a used pen. This small tube only serves to hold the wires (3 or 4 wires). With this simple solution you avoid chasing the wires for the table.

The pieces, 1-3-4-7 need to be glued.
Part number 2 must not be glued. It must be free to flow. It is used to establish the length of the pins. Piece number 2 is locked to the desired length by piece number 6 by means of the two screws.
When you cut the wires it is preferable to retain them with a finger.
When the track set you are using consists of 230 links, you can cut 150 pins.
I recommend cutting the pins slightly shorter. The pins must not protrude from the links. Only the last 5 or 6 pins need to be longer. This facilitates the extraction of the pins to eventually modify the length of the link chain.
